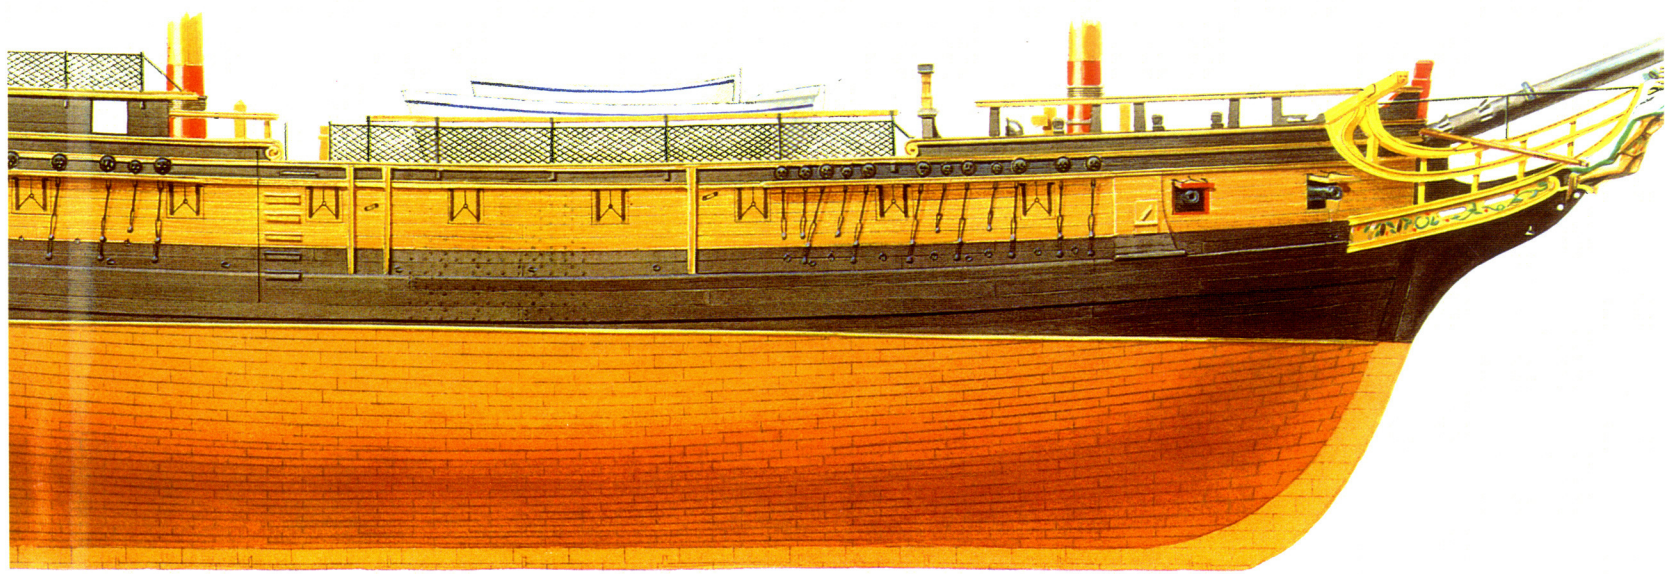
Anatomy of the Ship

Essex

THE 32-GUN FRIGATE *Essex*

PORTIA TAKAKJIAN



WAY

Contents

Introduction

The aftermath of the Revolution was a time of great political and economic difficulty for the United States. The most serious threat to the new nation's trade came from an unexpected source: the pirate Barbary states of North Africa.

Economic chaos dictated the sale of the remaining ships of the Continental Navy, while unprotected ships and seamen fell prey to the Dey of Algiers. Despite the raids by the Barbary pirates in 1785, Congress could not raise support for a permanent army or naval force. As attacks on shipping escalated, suggestions were made to comply with the demands of the Dey for tribute or to subsidize a European power to protect American trade.

Portugal's blockade of the Straits of Gibraltar had confined the Dey's activities to the Mediterranean until October 1793, when a twelve-month truce was established and Portugal lifted her blockade. Only then did Congress decide to protect American shipping by authorizing the construction of six frigates with a law passed on 27 March 1794.

Depredations upon United States' shipping and merchant seamen were not the only spur to action by the Congress. Attempts at neutrality in conflicts between the Dutch, British and French had proven futile. Without a navy to protect their interests, merchants in the United States were subject to soaring insurance costs, while at the same time losing ships and their cargoes; these merchants applied considerable pressure upon Congress for relief.

Despite the peace treaty signed with Algiers in September 1795, Congress authorized the construction of three of the original six frigates, the *United States*, the *Constitution* and the *Constellation*. In November of the following year Congress suspended construction after an unsatisfactory peace was signed with the Pasha of Tripoli.

The undeclared war with France was a direct result of the Jay Treaty, signed in 1794, and the notorious XYZ Affair in which France sought tribute for the protection of US shipping. Congress responded by the establishment of a naval department, and President Adams appointed Benjamin Stoddart as the first Secretary of the Navy on 18 May 1798. In April of that year Congress had authorized Adams to build, hire or purchase twelve ships, each to carry up to twenty-two guns. By an Act of 30 June 1798 the Navy Department encouraged the building, by subscription, of warships by private builders. Now Congress authorized the construction of the remaining three of the six original frigates of 1794, the *President*, the *Congress* and the *Chesapeake*.

In August of 1798 the subscription begun by the Salem merchants in June began to have an effect. The correspondence between the Senator from Massachusetts, Benjamin Goodhue, and the Secretary of State Timothy Pinkering reveal behind-the-scenes manoeuvres that would make Salem the building site for one of the proposed frigates. On 9 October, Benjamin Goodhue received a reply from Secretary of the Navy Stoddart confirming the building of the frigate *Essex*, and outlining the procedures required from either the frigate committee or the appointed agent. Selection of the builder and designer would be left to the agent or committee. They would also be allowed to select the men and officers to command the ship. The first order of business after the committee had been formed was the selection of William Hackett as the designer and superintendent of construction, followed by Enos Briggs as the builder.

William Hackett was born on 1 May 1739, one of four sons of William and Elizabeth Hackett. As a boy, until the age of twelve, he was employed in his father's shipyard at Salisbury, Massachusetts. After his father's death he moved on to other local yards. His name is linked with those of his cousin James 'Major' Hackett and his uncle, John Hackett, both shipbuilders in their own right. The seemingly military title of Major related to the hierarchy within the shipbuilding community; William was given the rank of Lieutenant at Lake George, where he was overseer of carpenters in 1759 while building the *Radeau* during the French and Indian wars, and his cousin James was ranked as Major while at John Langdon's shipyard at Portsmouth, New Hampshire, during the building of the Continental frigate *Raleigh*. Local militia men retained these ranks throughout their lifetimes, but it was William's association with his cousin James in joint building projects which caused the confusion between them in the attribution of the building and design of particular vessels. It is generally accepted that William was responsible for the designs of several Revolutionary War vessels including the brigantine *Massachusetts*, the sloop of war *Tyrannicide* (built at Salisbury in 1776), the sloop of war *Ranger* (built at Portsmouth NH in 1777 by his cousin James), the 74-gun ship *America* (also at Portsmouth and presented to the French government), and the Continental frigate *Alliance* (built in 1778 by his uncle John at Salisbury). After the Revolution he was engaged in design and construction, notably of the 600-ton merchantman *Massachusetts* launched at Quincy in 1789.

After this period little is known of his activities until 1794, when he is mentioned in a letter from the Secretary of War Henry Knox to Henry Jackson, the Navy Agent in Boston. By this time William was 55 years old, and it seems odd that the Secretary should have mentioned the name of his uncle John, who by then must have been well into his seventies, as the constructor for the *Constitution*. An extract from the letter follows:

Sir,
I am desirous that Mr John Hackett near Newbury Port who built the *Alliance* frigate during the late war should be engaged as constructor of the forty-four gun ship to be built at Boston — It is understood that there are three Hacketts, one of whom, named William, I believe, and is subject to temporary insanity — you will not engage. This point must be well ascertained.

Whether or not William was at this time confused with his cousin James is not known, but the stigma of this remark has been attached to William Hackett and his work on the draught of the *Essex* from that day forward.

The last ship designed and built by William Hackett was the 190-ton ship *Caroline* at Portsmouth launched in December 1800.

THE DESIGN

The controversy surrounding the draught of the *Essex* by William Hackett has been due, in part, to what some consider its unpolished state, questionable draughtsmanship and confusing lines. Enlargements of the photographic copies from the National Archives have done little to correct this image. On these copies most of the delicate pencil lines delineating the curved sweeps for the gunports, buttuck lines and diagonals, and the erasures and corrections which would contribute to a better understanding of the inked lines, are, for the most part, lost. Further efforts to create a so-called line copy from Hackett's shaded pencil and ink drawing render the design even more obscure. Despite this drawback, these line copies do serve a purpose: when enlarged, they reveal dramatically the significant notations made by Hackett. These are neither random nor arbitrary jottings; each has a distinct meaning. They offer us the unique opportunity to observe, at first hand, the eighteenth century design and construction techniques used by Hackett, and allow us to trace the designer's steps as his work on the *Essex* lines progressed. The following discussion of Hackett's design and its evolution can best be understood by reference to the draught and annotations reproduced on p26 below.

A clear understanding of this draught is essential to an understanding of the design of the ship herself; it is therefore important to decipher Hackett's notations and calculations and to find the probable sources for the proportions and rules he observed. The idea that American shipbuilders and designers existed in a kind of vacuum untouched by the design principles of their European cousins can be disproven by the weight of evidence to the contrary in the case of William Hackett and his lines for the *Essex* (see Table 2).

While it is possible that William Hackett worked by tradition and experience, there is strong evidence to suggest that he had access to tables of scantling, either transcribed from published works or the works themselves. It appears to be more than a coincidence that his proportions and dimensions match those from two major sources, *The Shipbuilder's Repository* of 1789, and Steel's *Shipwright's Vade Mecum* of 1805, a compendium of earlier published material with some revisions in the tables. These are of particular interest because both provide insight into the proportions which guided Hackett during the design, and cast light on the interesting question of how he arrived at the length of his gun deck and the distance between the fore and aft perpendiculars.

There is clear evidence that Hackett's draught is a working drawing, and something of his method is revealed within it. Two features of the draught are particularly informative: the framework of his station lines and the implications of his annotations and calculations.

The broadly spaced station lines on the draught include space for three

1 ft = 304,8 mm (pied)
1 " = 25,4 mm (pol)

TABLE 1: **DIMENSIONS**

	Hackett draught		12 December 1799 William Hackett (Superintendent) Enos Briggs (Constructor)		1807–8 Josiah Fox	
	ft	*in*	*ft*	*in*	*ft*	*in*
Length of gun deck	141		141		141	
Payable length of keel	118		118		118

Depth of hold	12	3	12	3	12	3
Height between decks (gun & lower)	5	10	5	9	5	9
Height under quarterdeck forward			6	3	6	3
Height under quarterdeck aft			6	6		
Height forecastle			6	2		
Height waist	6				6	
Length of quarterdeck			70			
Length of forecastle			34			
Deadrise*		(27)				27
Tonnage**					850 21/95 tons	

* Deadrise is not listed in the dimensions on Hackett's draught but is measured on the body plan.
** Tonnage noted on Joseph Waters' abstract of costs for the *Essex*.

intermediate frame bends marked by two short perpendiculars. Their placement between the fore and aft perpendiculars is based on the total number of feet in the fore and after bodies from the table. Forward of midships, these station lines are carried as far as station S and traces of faint pencil lines carry them still further to what would be the position of station X. Aft of midships, the stations are carried to number 30, although Hackett intended to bring them to 33, which is shown as the last station on his body plan. Each of the stations has been numbered and lettered along the top edge of the keel. There is no 'deadflat' in the true sense, but still Hackett has marked this area with repetitive numbers and letters to extend the waist.

This theoretical framework would serve, among other things, to work out the framing system and assist in determining the amount of timber required to build the frame bends. To this end, Hackett had to calculate the number of single frames between the fore and aft perpendiculars, and the number outside these limits. This brings us to the two groups of calculations located to the right of his scale below the sheer plan on the draught. These focus on his efforts to establish the final location of all the frame bends. He begins with preparatory calculations based on the fore and after bodies from the tables with a theoretical width of 2.22ft for each frame space, as follows:

Preparatory Calculations

1. Width of theoretical frame space 2.22ft, x number of spaces (54) on draught = 119.88ft (120ft allocated for square frame bends)
2. LBP 139.9ft, less 119.88ft = 20.02ft = number of feet for all cants
3. 20.02ft divided by two thirds for number of feet for fore and one third for aft cants
   = 6.67ft aft cants, 13.34ft fore cants
4. The number of feet divided by the frame space gives the number of frames fore and aft
   6.67 ÷ 2.22 = 3 frame spaces aft (measured to the fore side of the sternpost at the keel)
   13.34 ÷ 2.22 = 6 frame spaces forward (measured to the aft side of the stem at the height of the gun deck).

TABLE 2: **SOURCES OF DIMENSIONS AND PROPORTIONS**

	Dimensions	Proportions	Source	Remarks
	ft in			
Length of the gun deck	140 0		Table of scantling, *Shipbuilder's Repository*, 1789	Parallel to the keel at the height of the wing transom from aft side of rabbet of the stern to fore side of rabbet of stem
Depth of the keel	1 6		Table of scantling, Steel's *Shipwright's Vade Mecum* 1805 **	Includes 2in for rabbet of keel. See Briggs for timber 23 November 1798: 146ft, 16in square in four pieces
Siding of the keel at ⊗ *	1 4		Table of scantling, *Shipbuilder's Repository*	Measured from the aft side of keel
Depth of false keel	5		Steel's *Vade Mecum*	Measured along the range of gun deck
Length of the tread of the keel to the forefoot	128 0	5/12 length of gun deck (141.5ft)		Distance of forefoot to FP plus tread of the keel
Location of the midship bend*	58.95	1/12 141.5ft	Table of scantling, *Shipbuilder's Repository*	Measured at the gun deck. Used to find length of keel for tonnage
Distance of forefoot to fore perpendicular (FP)	11 9	Sum of 128ft + 11ft 9in	Table of scantling, *Shipbuilder's Repository*	Moulded breadth on table. Used as extreme breadth (Hackett).
Length between perpendiculars (LBP)	139 9	3/5 beam (37ft)		Measured from aft of FP at the top of the keel using Hackett's moulded beam (37ft)
Siding of stem	1 3			Measured from aft side of sternpost, to touch forward
Breadth of beam	37 6		Carpenters' rule 1799	118 × 37 (keel × breadth) = 4336 × 18½ (half breadth) = 80771 ÷ 95 = 850 22/95 registered tons.
Start of curve at the stem, and touch of the straight rabbet of the keel*	22 2	1/5 length gun deck (140ft)	Table, *Shipbuilder's Repository*	Measured at the height of the wing transom
Length of keel for tonnage	118 0	3/5 height of top timbers	Steel's *Vade Mecum*	Measured from the underside of the keel
Registered tonnage	(850 22/95 tons)	7/21 moulded breadth (37ft)		Measured from the top of the keel. Used to calculate displacement.
Rake of the sternpost from aft perpendicular	2 11			Follows general rule; 5–6ft above load waterline in frigates
Height of toptimber line	28 0			Steel gives proportion 7/20 measured from the upper side of beam of orlop to the strake next the limbers
Height of load waterline (LWL)	16 8		Table, *Shipbuilder's Repository*	This would have been the distance had Hackett carried his stations that far forward
Height at ⊗ of port sill above LWL	5 3		Tables, 'Bodies of a frigate of 36 guns', Steel's *Vade Mecum*	Total of fore and after bodies measured in feet = 120ft. The sum is used to calculate number of square and cant stations on the sheer plan
Depth in the hold	12 3		Tables, 'Bodies of a frigate of 36 guns', Steel's *Vade Mecum*	The sum 120ft is subtracted from the LBP (139ft 9in) to obtain the number of feet for cants.
Distance station X from FP	4 5			
In the fore body – distance ⊗ from FP	61 7			
In the after body – station 7 from the aft perpendicular	58 5			
Area for square frames	120			
Area for cant timbers (running feet)	19 9			

* Appears as a notation on the Hackett draught
** A compendium of earlier works from Mungo Murray, 1765; *Shipbuilder's Repository*, 1789; William Sutherland, 1794; Hutchinson, 1787.

Hackett saw that these figures clearly allowed too little space for the cants. The table in the *Shipbuilder's Repository* indicates that the square frames should be placed between midships and station P forward and between midships and station 21 aft. Hackett felt, correctly, that 21 was too far forward so he fixed station 29 as the position of his last square frame aft. These timbers and those following aft to the after end of the quarterdeck are calculated as single frames with a siding of 12in in the first set of calculations:

After Body Frames

0 to 29 (64 single frames)	63ft 7in, rounded to 64ft 0in
29 to after end of quarterdeck	19ft 9in, rounded to 19ft 4in
Total	83ft 4in

These figures are carried over to the second set of calculations which include the frames forward of midships and the hawse timbers. Here Hackett has begun at the fore side of the midship station and carried his square frames as far forward as the theoretical joint line of frame bend N, then forward as far as the joint line for the theoretical frame bend X. This location appears as a faint pencil line on the draught.

Fore Body Frames

	ft	*in*
Single frames from the fore side of 0 to joint of N forward	33	
Single frames from joint line at N to joint line at X	19	9
Sub-total	52	9
(From after body calculation)		
Total, rounded	83	
plus hawse timbers	4	
Total for fore body frames	139	9

Note: Aft frame spaces are numbered on the fore side; fore frame spaces are lettered on the aft side.

Later Hackett would again alter the space for the square frames bends by increasing the number of cants in the after body, thus shifting their position to station 24. Positive evidence of this change comes from two sources. The first is a tick mark Hackett made on his scale above the 21ft line; when this mark is raised to the top of the keel it falls on what would be the after edge of the first cant frame bend number 24. The position of the fore and aft cants in the reconstructed lines plan is marked by a heavy dashed line representing their centres, and it is these centres which gives us our second proof. Hackett used these lines to position his cants on the body plan. The distance from the centreline on the half breadth at the waterlines and diagonals has been measured square to the centreline, indicating the angle each of these takes.

On the sheer Hackett also indicated the amount of room and space he planned to use at the midship mark above the keel. The frames would be sided 11in and the space 3.8in. To maintain these proportions he would have to reduce the number of spaces occupied by the square frames from fifty-four to forty-five and redistribute the additional nine spaces. To arrive at the solution found in the body plan, it would have been necessary to draw a framing diagram using 2.15ft for room and space. The erasures on the draught indicate that Hackett observed the convention for two timber supports under the port sills. They also confirm the shift of the timbers at the forecastle and quarter-deck. The following shows how he arrived at the room and space figure:

Final Room and Space Calculations

LBP 139ft 9in, less cants (43ft) = 96ft 9in
96ft 9in divided by 45 spaces for square frames = 2.15ft, or 25.8in, total room and space
25.8in less siding of frame bend (22in) = 3.8in room

The next notation made on the keel by Hackett marks the location of the joint for the boxing of the stem. It is shown as a vertical dotted line just forward of station O. Following this mark, running up the stem, are the numbers 1–5. These correspond to the waterlines, with the exception of number 5 which represents the point on the stem where the upper height of breadth would terminate at the fore perpendicular on the sheer and half-breadth elevations. Hackett has also used this point on the half breadth for the termination of the dotted toptimber line at the bow.

The first waterline above the keel on the sheer is positioned at the height of the deadrise, 4 is the load waterline line and the two between, are placed at the designer's discretion.

Perhaps most puzzling of all the lines on the sheer elevation are the curved lines above the keel. They are drawn nearly parallel to one another, and the first has its height set at the deadrise at midships. This curve and the two above match the diagonal lines on the body plan at midships, but beyond this point they do not. If the diagonals of the forebody were projected to the sheer they would take on the shape shown on the reconstructed lines of the sheer. It is possible that the diagonals shown on the body plan may have been intended to represent diagonals for harpin moulds. The curves as drawn on Hackett's sheer appear to be the locations for the futtock heads. A slight adjustment of a few inches in the middle one brings the curve in line with the lower futtock. The heads of the third futtocks fall in line with the lower height of breadth for most of its length up to about station P. The heads of the futtocks then stay approximately in line with the middle of the main wale.

The lower height of breadth line appears on all the elevations, but on the main body plan is shown only as a short diagonal up to station S in the forebody and to station 30 aft. Beyond station 30 Hackett made corrections, as can be seen from the erasures made at 30 and 33, and at S.

The upper height of breadth line, normally now shown on any elevation, does appear in the reconstructed lines and framing diagram as a reference point for the reader. It was used in conjunction with the existing station curves for stations S and 27–33 to reconstruct the body plan.

In the reconstruction of Hackett's arcs, we can show how the curves are extended above the short diagonal line for the toptimbers in the fore and after

bodies. These short diagonals, however, define the limits of those timbers in the waist only. If projected to the sheer they define the underside of the deck at the sides for the quarterdeck and forecastle. Hackett has drawn in the toptimber lines for these areas on his body plan above the diagonals, which also stop at station S in the forebody and 33 aft; these features are shown in Figures 1A and 1B. With the end of this diagonal and the horizontal line representing the upper edge of the wing transom, Hackett gives us the upper limits of the fore side of his fashion timber.

We noted above the increase in the number of cants in the fore and after bodies, and the measurement for the room and space: both these influenced the *shift of timbers* seen in the disposition of the frames. As a consequence, Hackett's original number and letter system was altered. We can see from the reconstructed lines on the sheer that station 33, when compared with the framing diagram, falls on the fore side of the fashion timber 34. The cants 24 and 27 are also measured on the fore side. What is interesting is that station 30 on Hackett's original draught has been measured as a square frame at right angles to the centreline of the body and the half-breadth, measuring along the waterlines, and that it appears as the last designated frame space on his sheer elevation. The centre of the cant bend number 30 is used as an example in the reconstructed frames to illustrate the minor difference between Hackett's shape of number 30 cant and the canted version shown in the reconstructed lines elevation.

In the forebody Hackett used an entirely different method to describe the S cant. Again he used the fore edge of the cant drawn in the reconstruction but this time he measured the distance to the diagonals square from the centreline of the half-breadth, then transferred those distances to the corresponding diagonals in the body plan, with the one exception of the first diagonal. He then transferred the distance of the first diagonal on the half-breadth to the horizontal width of the floor. At the upper edge of the S cant he has indicated the flare taken by rail and the top of the timberhead.

A final interesting feature of Hackett's draught is the placement of the decks. It appears that he used the information already obtained for the location of the underside of the decks at midships, and then once again referred to the tables in Steel's *Vade Mecum* and the *Repository*. The depth in the hold gives the height of the berth deck. The distance between it and the gun deck above is 5ft 10in. The *Repository* calls for 1in more, as is true for the height to the quarterdeck, fore and aft. The height in the waist is the same as Hackett's measure of 6ft 0in. These internal measurements are taken from the 32-gun frigate in the *Repository* while those for the structure of the hull have been taken from a 38-gun frigate. Hackett deviated from the 4½in round-up of the gundeck listed in Steel and the *Repository* and kept his to 3½in. The height of the light room, filling room and magazine reveals the height of the platforms aft as 6ft 0in, and also confirms the cable tier as 5ft 0in. The last source for William Hackett's siding of the midship bend comes from the table of scantling in the 1765 edition of Mungo Murray. This table is based on the breadth of the vessel, and it appears that Hackett used the measurements for a vessel 36ft broad.

The terms berth deck and gun deck are those used at the period. They are used here to be consistent with Hackett's notes, and the Fox and *Essex* papers.

CONSTRUCTION, REBUILDS AND COLOUR SCHEME

Changes in the gun deck forward of midships, made shortly after the *Essex* was launched on 30 September 1799, do not appear on the draught; they were necessitated by the installation of the Brodie stove in the galley under the forecastle. The stove and the armourer's forge had both been imported from England, originally for use on the frigate *Boston*. Joseph Waters arranged with the *Boston* Committee for the stove to be sent to Salem where it was stored, partially dismantled, in a warehouse. The *Boston* was a smaller frigate than the *Essex* and it is possible that it was too large for the intended vessel, although no reason was given for its rejection by the committee. When time came to install the stove, it was found to be too large for the *Essex* as well. This required moving the fore riding bitts, and altering the position of the scuttle just forward of the bitts at the gun deck and the decks above and below. This alteration, and the changes ordered by Captain Preble after his arrival, added

42 days to the building time. Among the changes made by Captain Preble were the replacement of the wooden stanchions in the railings in the tops, the railing along the gangboards, and the hammock cranes at the rails.

The *Essex* seems to have retained her good sailing qualities as late as December 1805, when Commodore Preble's memorandum prepared for President Thomas Jefferson on the condition of the frigates of the United States, stated: '*Essex* — A prime sailer, and the best model of a Frigate (of her rate) in the Navy — requires rebuilding from the wales up.' These recommendations were not carried out until the *Essex* went into ordinary in 1807.

A preliminary survey made by Josiah Fox in 1807 indicated that seventy-five of her lower futtocks would need replacement; ultimately more than ninety were replaced. These repairs were to be carried out while the vessel was afloat, and Fox expressed his concerns about this method in a letter to Secretary of the Navy Robert Smith in June 1807. Fox identified a number of dangers which he felt might arise from the methods employed for the repairs:

> The principal dangers might arise from graving pieces secured in the planks to be removed; loosening of the butts; defective places in the planks; and also from removing too many planks at a time thereby leaving the planks without sufficient security, which may occasion the ship to strain when heaving down.

The sag in the quarterdeck, also mentioned in the first survey, was due, Fox felt, to the lack of pillars in the cabin below. Although there is no mention of pillars being installed it is likely that they were fitted during the 1807–9 refit.

While work was still in progress in January 1808, Fox suggested reducing the housing 9in a side, and shifting the position of the gunports so as to clear the shrouds. In his final report on 5 June 1809, he tells us that these changes were made in addition to raising her topsides, wales and thick strakes, settling the lower deck 2in, shortening the rake of the counter and cutting a row of air ports fore and aft. At this time the size of the gunports was also altered, in preparation for the change in the armament of the *Essex*. This is confirmed by a letter from Captain Charles Stewart to Secretary of the Navy Robert Smith dated 10 February 1809, requesting seven additional 32pdr carronades and eighteen carronnade carriages and slides proposed for the quarterdeck and forecastle. The number of ports was increased from ten (1808) to fourteen on the quarterdeck in February 1809. There was also a change in the dimensions of the magazine made during the refit but not mentioned in the final report by Fox.

After the refit by Fox was completed in 1809, the reputation of the *Essex* as a fine sailer was, for a time, lost. Changes to her hull form are suggested by the alterations made to her topsides. Later, Master Commandant David Porter was to complain of the disproportion of her masts and spars. It is not clear whether Porter was referring to the yards alone or to the whole spar plan in relation to the hull.

It is likely that Donald McIntire of Salem designed and executed all the carved work for the frigate *Essex*. Although there is no information to confirm this assumption, a painting at the Peabody Museum at Salem, thought to represent the *Essex*, gives a broadside view of the vessel illustrating an American Indian as the figurehead. Other examples of McIntire's work would suggest that the trailboards depicted in the Peabody painting are his design, and as McIntire was a trained architect as well as a ship carver with a strong classical influence, it could be expected that his figurehead would also reflect this influence. Since no drawings have been found of the figurehead, the cat's face at the end of the cathead, or the work at the stern and quarter gallery, it is ultimately impossible to say if these elements in the painting truly represent the work of McIntire, or whether these are the artist's additions.

The style used by the artist to represent the hull raises a number of questions. Among them are the designs on the quarter gallery, which may have been carved or painted. His use of white paint to depict the curve of the gallery below the windows might be the method of choice of an unskilled hand, yet it leads me to believe that what appears as lattice work on the hollow top might also be highlights illustrating the curved edge of shingles. This idea might also apply to the designs on the upper and lower finishings of the quarter gallery, but more questionable is the eagle with outstretched wings across the face of the drop. It seems an unlikely design, given the recessed extreme curves of this area and for this reason I have omitted it from the drawings. It is generally accepted that the colours in the painting do represent the paint work for the *Essex*.

The colours depicted match those listed in the account recorded by William Luscomb, painter and glazier, who worked on the hull and spars of the *Essex*. She is shown with a black hull above the copper with a broad ochre stripe running the length of the hull. A pale yellow is carried to the headrails and cathead, and the inboard face of the bridle port lid. During the first cruise of the *Essex*, Captain Preble had the interior of the gun deck painted yellow, perhaps to lighten an otherwise dark interior. The remaining port lids have their inboard faces painted vermilion red. A warm orange ochre is used as a background colour for the vine and flower design of the trailboards. The green vine is punctuated with small vermilion red flowers. The Indian figurehead wears a white cape with a wide green border; the girdle is spotted with red and green, perhaps representing coloured feathers, and the hair is black topped with feathers. Inboard, the knightheads and lower portions of the masts are vermilion red. The mast doublings and spars are black, but the outer end of the jibboom, flying jibboom, boomkins and masts, up to and above the caps, are all natural unpainted wood. It is also possible that the ochre stripe on the hull represents the natural wood payed over with tar. The boat at the stern is painted white with a blue stripe in the middle of a broader black one.

Construction of the *Essex* was assigned to Enos Briggs, a longtime resident and shipbuilder at Salem. It was he who placed the advertisement in the *Salem Gazette* on 23 November, calling for white oak timber for the hull, and more especially the keel, which was to be 16in square, in four lengths, totalling 146ft. By the end of December Enos Briggs had obtained the timber for the Salem frigate, but it would be several more months before the keel was laid. How much time was spent by William Hackett working on the lines from the end of October until the end of November can only be guessed. Yet enough must have been done so that Enos Briggs could contract with the Salem committee to construct a ship of 850 tons at $30.00 a ton on 30 November 1798. The schedule of Hackett's movements from the time the *Essex* was authorized to be built in early October 1798 until he took his final leave of Salem in November 1799 is recorded in Table 3.

While it is thought that the hull, outboard planking and much of the inboard works were constructed with white oak, considerable use was also made of pine. It was believed the chemical interaction of these two materials was responsible for much of the rot of the frames. In a letter to Captain Edward Preble dated 8 April 1803, the Secretary of the Navy calls attention to this problem with the *Essex*: 'It has been found by experience that the filling in a ship with pine timber is injurious to the frame. The frigate *Essex* is an instance of this.' It is not clear if this concern was recognized during the Fox refit of 1807–9, since his estimate for timber required for the interior of the hull does

TABLE 3: **WILLIAM HACKETT'S MOVEMENTS AND THE BUILDING OF THE SHIP**

1798		
October	*9*	Letter to Benjamin Goodhue from Secretary of the Navy Benjamin Stoddard authorizing work to begin on the frigate *Essex*
	24	Letter to William Hackett from William Gray of the Salem Frigate Committee asking him to come to Salem to discuss the frigate
	30	Hackett put on the payroll. Assumed to be in Salem at that time
November	*6*	Hackett and Ichabod Nichols go to Boston to confer with the Boston Frigate Committee
	7	Hackett and Nichols return to Salem
	8	Hackett returns to Salisbury
	13	Nichols goes to Salisbury to bring Hackett back to Salem
	23	Enos Briggs' advertisement appears in the *Salem Gazette* (146ft keel, 16in square, 4 pieces)
	23–30	Enos Briggs contracts with the Salem Committee to construct a ship of 850 tons at $30.00 per ton (including the timber)
		Hackett returns to Salisbury at or before the end of November
December	*1*	Hackett at Salisbury
1799		
January	*11*	Hackett at Salisbury; paid $100 on account
	11–30	Hackett returns to Salem. Remains until 30 January
	30	Hackett returns to Salisbury
February –		Hackett at Salem for 12 days (exact dates not known)
March	*11*	Briggs starts work on the keel. Requests that Hackett come to approve the scarfs
March	*11–*	Briggs spends 25½ days lofting moulds
April	*2*	
April	*2–*	Hackett returns to Salem. Twenty days at Webb Inn in April, remaining time lodged with
November	*30*	Jonathan Brown
April	*13*	Keel is laid
	23	Floor timbers installed on the keel
May	*28*	Hackett writes to his son requesting his 'sweeps' to draw the final draught of the *Essex*
September	*30*	*Essex* launched
November	*30*	Hackett returns to Salisbury

not square with the type used. Some shipbuilders at this period used rock salt, as they do today, packed between the frames in the hold to minimize the effect of moisture, but there is no evidence that this was done with the *Essex*.

Because we have only fragmentary accounts from contracts with other builders of the period we can only assume that some of the methods used at other yards were adopted by either Hackett or Briggs. Both men, especially Hackett, were experienced and were familiar with other builders. Hackett's detailed notes would indicate that he was observant and interested in the methods of others. It is quite possible that he incorporated the method of dovetailing the beams into the clamps of the gun bearing decks to minimize the racking of the deck from the discharge of the guns. The exposed edges of the overhead beam might also have been chamfered to lessen the possibility of splinters flying off during combat.

American shipbuilders seemed to favour the use of planking with fair edges in parallel lengths rather than the use of top- or hook-and-butt planking used by their English cousins, and this is confirmed by Hackett's notes, so it is assumed in the reconstruction of the hull planking that parallel lengths were used. Thrift might have been a factor in the use of stiff brown paper as doubling for the coppered bottom rather than felt, or it may simply have been used to minimize the puckering associated with the use of felt. After the ship had been hoved down to complete the coppering, her false keel, previously coppered, was then installed. Good sense did not override thrift in the use of wood for stanchions in the waist, hammock cranes or railings in the tops. Splinters from these during battle could be lethal, so Captain Preble had them replaced with iron before the *Essex* left on her first cruise.

TABLE 4: **COSTS OF BUILDING**

Subscription Funds	*Dollars*	*Cents*
Constructor	921	54
Building	26,616	64
Iron work	8371	94
Cordage	10,075	03
Sundries (spars, boars, blocks)	12,723	91
Painting and plumbing	2256	35
Carving	410	00
Duck	3731	74
Anchors	1081	92
Copper bolts	4339	05
Sailmakers (labour)	730	24
Tradesmen (labour)	2735	36
Commissions on 73,993.72 (« 2% (Navy agent Joseph Waters)	1479	87
	75,473.	59
Government funds		
Ordnance, military stores, kentlage, copper	31,992	76
Ship's stores (12 months)	12,709	19
Provisions (12 months)	12,304	52
Slop clothing	3868	79
Hospital stores	1526	20
Extra – sail, duck, anchors, spars, cables, (labour and commissions)	16,812	72
	154,687.	77

Nearly half the cost of building the *Essex* was born by the subscription funds, thus making her eligible as a loan to the government. The actual cost to subscribers before the commission fee of Joseph Waters was $73,993.72 which left a deficit of $773.59 over the subscribed amount of $74,700.00.

ARMAMENT AND FLAGS

During the period 1790–98 there was no Navy Department and naval affairs were under the jurisdiction of the War Department. In September in 1796, preparations were being made to procure ordnance for the *Essex*, among the three frigates then under construction. A letter dated 13 September 1796 from the Secretary of War to the Secretary of the Treasury details the conditions to be adhered to in contracts for the manufacture of cannons that would be issued by the Treasury Department. Two of the conditions set forth are of interest because they illustrate the point that American guns of that period were intended to be patterned after English designs.

The first example is condition number two, 'That the twenty four nine pounders and twelve six pounders conform exactly in weight, bore, caliber, and length, to British Ship Guns of the same dimensions now in use.' The second example, number seven, is particularly relevant to the guns carried by the *Essex*:

> That the trunnions must be perpendicular to the vertical plan which is supposed to pass through the touch hole, and to cut the bore into two equal parts. That the *upper part of the trunnion shall be level with the center of the caliber, or bore* [author's italics], and that the usual relative weight be preserved between the breech and the chase.

Although rated as a 32-gun frigate, the *Essex* carried twenty-six 12pdrs on her gun deck and ten 6pdrs on the quarterdeck, two of which would be used at the forecastle as needed. All her guns were of English manufacture and were acquired from two sources — the Navy agent in Boston and the Boston Frigate Committee.

In a letter to the Navy agent, Joseph Waters, Secretary of the Navy Stoddart

gives the lengths of the long 12pdrs and 6pdrs at 7½ft and 5½ft respectively. These were to be supplied by Lane & Salter or Foxall & Co, while those offered by the Boston Frigate Committee would be those left over from a parcel of guns purchased at Halifax. This set of guns would be shorter by 6in and from 3cwt to 4cwt lighter. The Committee's guns were all 12pdrs weighing between 23cwt and 25cwt.

Nothing is mentioned about the position of the trunnions, but because all were of English origin, it can be assumed that the trunnion centreline was below that of the bore. This could explain the difficulties encountered by Captain Preble when the time came to mount the guns on their carriages. When he inspected them in November 1799 he found all of them too high for the port openings. He had the guns dismounted and the carriages sent ashore to be altered.

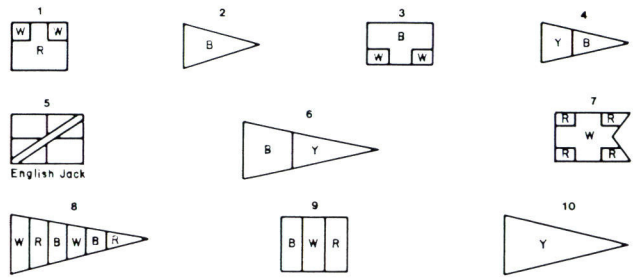
A drawing of the gun carriages of the *Essex* is among the Fox papers at the Peabody Museum at Salem. On the drawing is a notation which reads, 'beds and skids for spar deck not begun'. The drawing is not dated, but the date implied by the notation is during the 1807–9 refit when the *Esses*'s ports were altered for the carronades.

An abstract from the journal of Captain Edward Preble dated Friday 14 February 1800 reads, 'Dismounted two of the quarter-deck guns and stored them below, as they could not be worked clear of the main shrouds.' This statement appears to confirm the position of the shrouds during the first cruise to the Mediterranean as that indicated on William Hackett's draught. The second foremost leg of the main shrouds obstructs the first gunport aft of the break of the quarterdeck, rendering guns at that position useless. Hackett had called for six ports a side on the quarterdeck on his draught. However, it is possible that this port was boarded over during December of that year when the *Essex* put in for repairs at New York. Her main lower mast was replaced, and a new gang of shrouds was installed at that time. If the port had been boarded over during the repairs it would explain the five ports on the Peabody painting, and the total of ten ports on the quarterdeck found in the Fox survey of 1808, prior to repairs. After that, in February 1809, the *Essex* is listed as carrying seven ports a side. Later, in January 1810, her armament would again change to 32pdr carronades on the gun deck, in place of her long guns.

Included in the Gunner's indent are the small arms furnished by the Navy Department through the firm of Foxall & Salter, who also provided a set of signal colours. The small arms listed were: 100 cutlasses, 60 muskets and bayonets, 30 pairs of pistols and 100 boarding pikes.

The Armourer's indent lists a forge. A description of the forge and its equipment are among the *Essex* papers at the Peabody museum at Salem, and it also appears in the appendices of Philip C F Smith's book *The Frigate Essex Papers*. The forge shown in the drawings is theoretical and was drawn after a discussion with a master gunsmith familiar with forges of that period. He felt the beehive shape would be the most efficient one for generating heat quickly for the purpose of heating shot to be used as 'hot shot'. The tray under the forge held the shot to fill the furnace, then when hot it was removed with the ring shovel. Prior to loading, the gun was packed with a wad of wet straw and another of clay to prevent premature firing of the gun. The forge would be positioned about amidships on the gun deck and is estimated to be approximately three to four feet square.

Prior to the return home of the *Essex* from Batavia in June 1800, Captain Preble issued a set of signal colours to the fifteen vessels the *Essex* would escort. The last vessel listed in the table, the ship *Magnus*, appears not to be among that returning group. The signal flags would make 108 days signals, and were



Flag	*Position*	*To designate*
Red	Fore	Ship *D. Terry* and brig *Sally*
Red	Main	Ship *China* and brig *Exchange*
Red	Mizzen	Ship *Smallwood*
White	Fore	Ship *Dispatch* and brig *Delaware*
White	Main	Ship *Nancy* and brig *Globe*
White	Mizzen	Ship *John Bulkley*
Blue	Fore	Ship *Juno* and brig *Lapwing*
Blue	Main	Ship *Hebe* and brig *Lydia*
Blue	Mizzen	Ship *Magnus*

issued to each vessel in the convoy, along with a code for night signals, on 14 June 1800; these are shown above.

Not until the official regulation of 1795 was any attempt made to establish a design for the national ensign. Naval flags were also effected at that date. While the regulation specified fifteen alternating red and white stripes with fifteen white stars on a blue field next to the hoist, this last part of the regulation produced a number of variations based largely on the whim of the flag makers. Among the more popular variants was the design shown in the drawings. This flag was normally flown at the peak, but would be carried at each masthead during battle. The jack was an adaptation of the blue field with white stars; it was also flown at the fore mast. The commissioning pennant would have been carried at the main truck when the *Essex* left Salem on her first cruise. The design for this was also subject to alteration in the arrangement of the stars, but it is shown in the drawings as illustrated in the Peabody Museum's painting of the *Essex*. This pennant would be replaced by the Commodore's broad pennant, designating the vessel as the flagship of the squadron. The blue swallow-tailed flag carried fifteen white stars in a circle representing each of the states in the republic, and one large central one, representing the nation.

RIGGING AND SAILS

On 20 February 1799 a contract for spars was signed between the Salem Frigate Committee and Nathaniel Guptail of Portsmouth, New Hampshire. He agreed to supply two of each spar required with the exception of the lower masts, driver boom, crossjack, and spritsail yards. Of these there would be only one. The lower masts, bowsprit, main and fore yards would all be pine and the remainder of spruce. This contract did not furnish all of the spars for the *Essex* nor those needed for the ship's boats. These were provided by Hawkes and Babbidge of Salem. The studdingsail yards, flying jib and mizzen boom are missing from Guptail's list, as is the dolphin striker. This last spar appears in a list of the *Essex* spars at about 1808 during the period of her last refit. At that same time skyscraper masts were added to all three masts, and royal studdingsail booms and yards added to the main and fore. The ringtail

TABLE 5: **ARMAMENT CHANGES AND RELATED ORDERS**

1799	
December	Hackett's design, *Essex*: 44 ports – 12 quarterdeck, 4 forecastle, 28 gun deck (including 2 bridle ports)
1800	
14 February	Preble dismounted 2 quarterdeck guns in the wake of the shrouds – stored below
25 December	*Put into New York for repairs. New Main lower mast and shrouds installed
1808	*First Fox survey*: 10 ports total on quarterdeck, 26 on gun deck (excluding 2 bridle ports)
20 January	*Captain Thomas Tingey, Commandant Washington Navy Yard to Secretary of Navy Robert Smith* Suggests making immediate change in armament on *Essex* since topsides now being replaced. Change in position of shrouds also needed
1809	
6 February	*Robert Smith to Captain Charles Stewart* You will assume command of the *Essex*, superintend equipment, prepare her for service
February	*Second Fox survey*: 46 ports total – 14 ports on quarterdeck, 4 forecastle, 26 gun deck (excluding 2 bridle ports)
10 February	*Captain Stewart to Robert Smith* List of required crew for 46-gun frigate *Essex*
10 February	*Captain Stewart to Robert Smith* Requests 7 additional 32pdr carronades, also 18 carriages and slides proposed for the quarterdeck and forecastle
31 March	*Acting Secretary of the Navy Charles W Goldsborough to Captain John Smith* You will assume command of the *Essex*
March	*Essex* on Station at Hampton Roads
2 June	*Thomas Tingey to Secretary of the Navy Paul Hamilton* Work progress slow on fitting carronade carriages at Washington Navy Yard. Requests permission to send *Essex* to Norfolk to complete the work as suggested by Captain William Bainbridge
1810	
21 January	*Captain John Smith to Paul Hamilton* Acknowledges agreement of Hamilton to more efficient armament for the *Essex*. Requests order for 24 carronade carriages and slides. Tells of previous difficulties with installation of quarterdeck carriages, thereby requests *execution attained* in vicinity (Norfolk) where she can remain until work is completed (gun deck)
6 February	*Paul Hamilton to Captain John Smith* 32pdr carronades being cast at Foxall & Co
10 February	*Captain Smith to Paul Hamilton* Receiving order for making 24 carronade carriages at Norfolk. Will proceed immediately. Suggests lowering for end of orlop deck. Request denied by Hamilton
Guns	
1799 December	36 guns total: ten long 6pdrs for the quarterdeck and forecastle, twenty-six long 12pdrs for gun deck
1809 February	46 guns total: eighteen 32pdr carronades for the quarterdeck and forecastle (plus two long 12pdr chase guns), twenty-six long 12pdrs on gun deck
1811 August	46 guns total: sixteen 32 pdr carronades, three long 12pdrs on spar deck; twenty-four 32pdr carronades, three long 12pdrs on gun deck until capture

* Possible boarding up of the first port.

Jack staff**	16		4¾		

* Length inboard from the fore side of the stem to the aft side of the bitts 16ft. Length above includes 12in heel.
** Not on the Guptail list. Dimensions taken from the Fox 1809 and Navy yard 1808 lists.

boom and yard mentioned in the rigging contract with McClennan & Saunders only appears on the 1808 list.

The various spar lists found in the appendices to Philip C F Smith's book *The Frigate Essex Papers* give a detailed account of these differences. Included is the handwritten list made by Enos Briggs of Guptail's original proposed dimensions. This same list found its way into Captain Preble's papers, presumably passed on in the event of needed repairs. For reconstruction purposes the dimensions for the flying jibboom and dolphin striker have been taken from the 1808 list, and the remaining spars' dimensions from the Guptail list which accompanied the contract.

The man responsible for converting the raw sticks into the spars was Luke Laighton of Portsmouth. His correspondence with Joseph Waters confirms the use of iron hoops on the bowsprit, and, presumably, the masts in conjunction with the woolding. At the end of January, during the first cruise of the *Essex*, she sprung her mainmast in a gale, some three feet above the wedges between decks. The following day the crew was set to fishing and woolding the mast and getting up the preventer shrouds. Preble's letter to the Secretary of the Navy reporting the damage to the masts and rigging describes the iron work on the masts as being of very poor quality. During that storm, the fore and main trestletrees gave way, as did the rigging and most of the ironwork. At the end of December the mainmast was removed and a new one put in its place ten days later. Her mainmast and foremast would be altered during the 1807–9 refit, after which the *Essex* lost her fine sailing qualities. When Porter took

* Indicates missing item from Hackett's list of rigging cordage.

command he complained bitterly of the disproportion of her masts and yards, and suggested replacing the foremast with the reworked mainmast, and then building a new main. These new dimensions are listed as Item 566 in the Fox papers at the Peabody Museum.

The *Essex* carried a total of thirteen square sails (including spritsail course and topsail), a driver, twelve steering sails (studdingsails) and eleven staysails. These were provided by Buffum & Howard of Salem who also provided the ship's boats' sails and canvas covers.

The *Essex* carried at least one lightning rod, probably on her mainmast truck. Both the rod and conductor chain were made by Paul Revere. The copper rod was silvered and it is assumed the fine chain was wrought of copper. Possibly the rod was fixed French fashion through a system of plates and connecting chains beginning at the highest point at the truck of the main royal pole mast to the topgallant mast cap, then down to the lower caps, and along the aftermost leg of the main shroud to the channels. Here the chain was flaked for instant release at the first sign of storm, when it could be dropped over the side. Three or four fathoms was considered sufficient length to assure that the chain would remain immersed during a storm. Whether it had more than one leg, as the French used, is not known.

A document from the US Navy Board's New Book dated 6 October 1796 illustrates plan views of tops for a First Class frigate and for a sloop of war. The design of the tops represents a radical departure from those used on English ships of war at that period. Because they are nearer in size, the proportions of the tops for the sloop of war were used in the reconstruction of the tops for the *Essex*. The length of the crosstrees had to be altered from the proportions given in Steel's tables to suit the shape of the tops, the foremost one shorter, while the aftermost crosstree was increased in length. The main top was the basis for the remaining two. No provision was indicated on the drawings for the crowsfeet called for in Steel's rigging lists, and which appear in the painting of the *Essex*. These have been added to the tops on the strength of the painting, the usual practice of the period and Steel's list. Two sleepers, or upper crosstrees, span the tops at the fore and after edges of the lubber's hole. At the centre forward of the foremost sleeper is a small oval hole for the lower yard slings. Behind it and on top of the sleeper is a half-round bolster.

SERVICE HISTORY

Captain Edward Preble was not the first choice of the frigate committee as commander of the *Essex*, but it is fortunate that he became so, in light of her difficult passage to Newport and around the Cape of Good Hope to Batavia. A man of lesser mettle might not have performed as well in response to the damage inflicted on the *Essex* and her crew by the violent storms she encountered.

One of the last acts of the Adams administration was to order a squadron, under Commodore Richard Dale, back to the Mediterranean to protect American shipping from the Barbary pirates. The *Essex*, now under the command of Captain William Bainbridge, sailed with the frigates *President* and *Philadelphia* and the schooner *Enterprise*.

With the Jefferson administration about to take over the reins of government, Benjamin Stoddart made an attempt to preserve the Navy as it had grown during the Federalist period. However, the Jeffersonians and the anti-navalists in the Congress passed the Peace Establishment Act on 3 March 1801, the day before Jefferson was inaugurated. As a result of this act, some twenty smaller Navy ships were sold and seven frigates, including the *Essex*, were placed in ordinary (reserve). Only six frigates were to remain on active service. By June of that year the Pasha of Tripoli had declared war on the United States for non-payment of tribute, but not until the following February did Congress recognize a state of war with Tripoli. The Barbary Wars would continue until June 1805, and a permanent peace would not be established until after the War of 1812 when Commodore Stephen Decatur effected a peacy treaty with the Dey of Algiers in May of 1815.

The Treaty of Paris ended the war with France in December of 1801. In spite of the position of neutrality taken by the United States in the European war, her shipping would continue to be interrupted by the warring nations.

The *Essex* was brought out of ordinary in the spring of 1804 and again sailed to the Mediterranean with Captain James Barron, under Commodore Samuel

Barron. *Essex*, in company with the *President, Constellation* and *Congress*, was sent to reinforce the Mediterranean Squadron and would remain there until July 1806, when she returned to the Washington Navy yard to be placed in ordinary under Commodore John Rogers.

In December of 1807, Congress authorized the building of 188 gunboats, bringing the total to 257. At the same time the Non-Importation Act went into effect and an embargo was placed on all foreign commerce. The result was a deep depression and widespread discontent, bringing the United States to near financial ruin. The embargo was lifted in March 1809 and replaced with a Non-Intercourse Act, which prohibited commerce with Britain or France.

The *Essex* remained relatively inactive, although on station, after her refit was completed in 1809 until ordered to Europe in November 1810. She was under the command of Captain John Smith and was sent bearing dispatches to France and Britain concerning the deteriorating relations between the United States and Britain. She returned to the United States the following July, and in December was again on station at Newport under Commodore John Rogers.

The 90-day embargo on all British shipping declared by President Madison in April 1812 signalled the preparations for war with Great Britain. American naval officers fitted out their ships in spite of shortages in men and materials. The *Essex* was put back onto ordinary in June at New York, to refit her masts, under the command of Master Commandant David Porter. Despite Porter's objections to her armament, the *Essex* left New York carrying forty 32pdr carronades and six long 12pdrs. The repairs to the *Essex* delayed her departure from New York as part of Commodore John Roger's squadron. Porter was instructed to proceed south in search of the British frigate *Thetis*, then to use his judgement in departing from those orders if necessary. From 11 July to 13 August, when Porter captured the 20-gun sloop of war *Alert*, he cruised north to Newfoundland. On 12 September he completed his first cruise with the capture of several small British vessels and returned to the Washington Navy yard for minor repairs.

Porter's second cruise would take him to the Pacific. The Navy had been organized into three squadrons, each composed of two frigates and a sloop of war. The *Essex* was to join Commodore William Bainbridge's squadron of the *Constitution* and the *Hornet*; sailing singly or together, they were to proceed to the Cape Verde islands, back across the Atlantic to the Island of Fernando de Noronha, then south to Brazil. Depending on circumstances, they could then head for St Helena or the South Atlantic to seek British whalers in the Pacific.

After stopping at Noronha and leaving word for Commodore Bainbridge in December of 1813, Porter rounded The Horn into the Pacific Ocean. From March of that year until September he captured fourteen British whalers. The 8-gun *Atlantic*, captured early in May, was refitted and renamed *Essex Junior*. She was placed under the command of Lieutenant Downes who was then given sixty men. The *Essex* and *Essex Junior* left the Island of Nukahiva on 12 December bound for the harbour of Valparaiso.

In February 1814 the *Essex* and her consort arrived at Valparaiso, only to have the British frigate *Phoebe*, Captain James Hillyar, and HM Sloop *Cherub* appear off the neutral port. Porter left the *Essex Junior* on patrol while he brought the *Essex* into port. Weeks of taunts followed between the two adversaries, while the two British ships replenished supplies. Porter tried in vain to bring Hillyar to a single ship duel. Then on 25 February, Porter towed his two prizes, the *Hector* and the *Catherine*, out into the harbour and burned them.

From that day forward Hillyar kept the entrance to the habour well blockaded. In late March Porter concluded that he must try to make a break for open water. On the 28th he put on all sail, but a vicious squall confronted him, carrying away his main topmast. As the *Phoebe* and *Cherub* closed in, Porter ran the *Essex* into a small bay some miles from the city and 'within pistol shot' of shore, dropped anchor. Porter's worst fears were realized when *Phoebe* positioned herself beyond the range of Porter's carronades. With the *Phoebe* off her stern and the *Cherub* off her bow, Porter could only run three of his long guns out the stern windows. After three hours of determined fighting the *Essex* struck her colours.

CAREER SUMMARY
FIRST COMMISSIONED OFFICER CAPTAIN EDWARD PREBLE

1799	
December 22	Sailed from Salem to join the Frigate *Congress* at Newport, Rhode Island.
December 27	Arrived Newport – completed ship's complement of marines.
1800	
January 7	Sailed for Batavia and Java with *Congress*, convoying three merchant vessels.
January 11	Parted with the three merchant vessels.
January 13	Heavy gales 24 hours. Shipped water down fore hatchway. Bored holes in waterways below decks to clear water.
January 14	Repaired storm damage to rigging.
January 16	Storm carried away one main shroud.
January 17	Repaired sails and rigging.
January 24	Main mast sprung between decks. Secured main mast and rigging.
January 25	Main trestletrees broken; fished and woolded main mast. Set up preventer shrouds.
February 7	First American warship to cross the equator.
February 14	Lost two able seamen overboard. Dismounted two quarter-deck guns and stowed them below.
March 18	(Harbour of Table Bay) repaired rigging.
March 28	Got up topmasts and yards.
March 28	First American warship to round the Cape of Good Hope.
March 29	Strong gales carried away main trusses, preparing more.
May 6	At anchor Claps Island. Saw sail, fired two guns, gave chase. Brought ship to anchor, found her American ship commanded by a Frenchman. Took out our officers and men. Ship condemned.
May 15	Anchored off Onrust Isle. Fired 16-gun salute, answered from fort. Captain preble went ashore in the barge.
May 18	Anchored at Batavia Roads. Draught of water 18ft forward, 18ft 11in aft.
July 1	Proceeded to sea with 14 sail under convoy to the United States.
September 15	At anchor at Island of St Helena Roads.
November 28	Arrived at New York. Four sick on board.
December 25	Moored in Wallabout Bay on Long Island side. Mainmast taken out and replaced – new gang of main shrouds. Kept 35 of crew to keep the ship. New boats being built for the ship. Ship placed in ordinary, Mr Phipps and Mr Lee officers in charge to be relieved by Mr Beale and Mr Tew.
December 31	Stowed sheet anchor below unstocked

15

1801

February 3 Congress ratifies peace treaty with France.
April 1 Received orders to prepare the ship for 12-month cruise and sail to Hampton Roads to join squadron.
May 14 Set sail for Hampton Roads.

SECOND COMMISSIONED OFFICER CAPTAIN WILLIAM BAINBRIDGE

May 20 US ships under Commodore Dale sail to the Mediterranean for the protection of American commerce from the Barbary pirates.
July 1 Arrived at Gibraltar.
July 4 Sailed out of the Bay of Gibraltar with the ship *Grand Turk* and brig *Hope*.
July 13 Crew employed painting boats, fitting preventer braces fore and aft for lower topsail yards.
July 19 Arrived at the Bay of Tunis. Received orders to proceed to Barcelona for convoy duty through the straits of Gibraltar.
July 21 Weighed anchor. Brig *Hope* in convoy to Sicily.
July 29 Arrived at the Bay of Marseilles.
August 2 Came to anchor at Barcelona Roads. American consul came alongside but could not board.
August 3 Commenced getting ballast and water.
August 9 16 sail under convoy, one Swedish ship permitted among fleet.
August 15 At island of Plane. Saw xebec, gave chase. Brought him about, ordered him to heave to with no effect. Fired into him, hauled down his colours, found him a Morrish ship belonging to Tangiers. Dr Wells went aboard to treat wounds.
August 31 Arrived at Gibraltar.
September 1 Weighed anchor, beat out of Bay under double reefed topsails.
September 7 Came to anchor in Malaga Bay in 15 fathoms water, about 15 sail waiting in this port for convoy, now loading.
September 12 Weighed anchor sailed out of bay.
September 22 Arrived Bay of Tunis.
September 23 Came to anchor Cape Catharge.
September 25 In company with the *Philadelphia*, beating out of bay of Tunis.
September 28 Made town of Tripoli in company with *Philadelphia*.
September 29 Fired on by two gun-boats, returned shots. Went on board *Philadelphia*. Captains Barron and Bainbridge agree to leave the station.
October 25 Lying in the Bay of Malaga with a hard gale blowing. Four American vessels in this port awaiting convoy. Prepared to sail.
October 27 Brought to anchor in the Bay of Algeriras. Received provisions.
December 19 Hard gales. Took in flying jibboom. 7 pm fell in with convoy from Malaga.

1802

February 6 Congress recognized a state of war with Tripoli.
[illegible] Anchored at Bay of Algeriras. Blockade duty.
June 16 Sailed from Gibraltar for New York.
July 14 Off Sandy Hook. Commenced painting ship's sides.
July 15 Gale carried away main topmast, main and fore topgallant yards split, main topgallant and two seamen lost.
July 15 Swayed up new main topmast, topgallants.
July 23 Arrived New York. Received orders to proceed with ship to Washington.
July 29 Got ship underway and beat down.
August 2 Laid up in ordinary under sailing master Richard Butler.
August 9 Anchored below Smith's point. Pilot ran us inshore to the entrance of the Eastern Branch.

1803

October 12 Congress ratifies peace treaty with Morocco.

1804

May *Essex* recommissioned.

THIRD COMMISSIONED OFFICER CAPTAIN JAMES BARRON

June 3 Assigned to reinforce the Mediterranean squadron.
July 4 Sailed with the *President*, *Congress* and *Constellation*.
August 17 Arrived at Gibraltar. Left on blockade duty until relieved by brig *Siren* (30 August).
August 30 Left Gibraltar.
November 2 Arrive at Syracuse harbour.

1805

February 4 Sailed to Malta with Commodore Samuel Barron seriously ill.
March 3 Ordered to sail to Venice to obtain a bomb vessel.
March 21 Impossible to cross the bar at Venice.

FOURTH COMMISSIONED OFFICER CAPTAIN GEORGE COX

May Ordered to Syracuse to pick up Tobias Lear.
May 29 Colonel Lear, Commodore John Rogers aboard *Essex* in Tripoli harbour. Raised white flag, answered by Pasha.
June 3 Peace treaty signed with Tripoli. Prisoners aboard the *Constitution* released. No further tribute paid to Tripoli.

FIFTH COMMISSIONED OFFICER CAPTAIN CHARLES STEWART

July 6 Charles Stewart appointed commanding officer.

SIXTH COMMISSIONED OFFICER CAPTAIN HUGH G CAMPBELL

August 22 Ordered to remain on station at Tunis.
September 5 Sailed from Tunis to Algeciras. Cruised this port, Tangier, Gibraltar and Cadiz until 30 May 1806.

1806

April Congress enacted a law prohibiting importation of British goods.
May 30 Exchanged ships with Commodore John Rogers of the *Constitution*.
June 4 Sailed from Gibraltar to Washington.

16.

July 25 Off the Delaware Capes.
July 28 Arrived at Washington. Laid up in ordinary to February 1809.
November 21 Napoleon issued Berlin Decree prohibiting trade between neutrals and Great Britain; US exempt.

1807
January 7 Great Britain decreed no neutral ships could sail between French ports.
July 2 President Jefferson ordered armed British ships out of US ports as result of *Leopard–Chesapeake* action.
November 11 Great Britain decreed neutral nations could not trade with France and her allies unless tribute was paid to Britain.
December 11 Napoleon's Milan Decree — all neutral ships paying tribute to Britain subject to confiscation by France.
December 14 Non-Importation act went into effect.
December 22 US declares embargo on all foreign commerce.

1808
April 17 Napoleon issues Bayonne Decree. American ships in violation of embargo seized.

1809
January 9 President authorized to recommission the *Essex*.

SEVENTH COMMISSIONED OFFICER CAPTAIN CHARLES STEWART
February 10 Stewart takes command. Change in armament to eighteen 32pdr carronades on the quarterdeck and forecastle.

EIGHTH COMMISSIONED OFFICER CAPTAIN JOHN SMITH
March 31 Smith takes command. *Essex* placed on station at Hampton Roads, Virginia.

1810
January 2 Napoleon instructs King of Naples (Murat) to seize all American ships and their cargoes.
February 2 Letter from Captain John Smith to Secretary of Navy Hamilton about fitting twenty-four 32pdr carronades and slides on the orlop (gun) deck.
March 23 Napoleon signs Rambouillet Decree. All US ships seized prior to 20 May 1809 condemned as prizes and could be sold.
May 1 Non-Intercourse Act 1809 suspended with proviso for reapplication should France or Great Britain again disrupt US commerce.
November On station at Hampton Roads. Ordered to Europe with dispatches relating to deteriorating relations with Great Britain.
December 4 Entered L'Orient.

1811
January 12 Arrived in England with dispatches for William Pinkney, returned to France for return dispatches, then on to Cowes, Isle of Wight, to pick up Pinkney and family to return to the US.
March 2 Non-Intercourse act invoked against Great Britain.

NINTH COMMISSIONED OFFICER MASTER COMMANDANT DAVID PORTER
August 9 Porter takes command.
October 12 Captain Porter writes Secretary of the Navy Hamilton objecting to the use of carronades aboard the *Essex*.
December *Essex* on winter station at Newport, Rhode Island, under Commodore John Rogers.

1812
June 18 War declared with Great Britain.
June 22 Repairs at New York Navy Yard. Caulked inside and out. Copper repaired; both sides hove out. Removed masts. Main-mast altered for foremast. New main and mizzen masts installed.
July 2 David Porter promoted to Captain.
July 3 Sailed from New York. Ordered to St Augustine in search of *Thetis*.
July 11 Cut out transports *Samuel* and *Sarah* from a convoy of 7 protected by brig sloop *Nimrod*. Ransomed for $12,000.
July 13 Brig *Lamprey* captured. Sent to Baltimore as a prize.
July 26 Captured brig *Leander* off Newfoundland. Dispatched as a prize.
Aguust 2 Captured ship *Nancy* and brig *Hero* off Newfoundland, dispatched as a prize.
August 3 Captured and burned the brig *Brothers* in the Atlantic.
August 7 Brig *King George* captured and sent to Boston as a prize.
August 9 Brig *Mary* captured and sent back to the US with prisoners from previous captures.
August 13 Captured HMS *Alert* (16 guns) in the Atlantic; sent to St Johns with Captain Laugharne with promise to send her later to US.
September 4 Chased by British squadron, but eluded them.
September 7 Passed Delaware Capes into Washington Navy Yard for minor repairs.
October 6 Ordered to join squadron under Commodore William Bainbridge and to rendezvous at St Helena.
October 27 Departed Delaware Capes on cruise to Pacific for attacks on British whaling fleet.
October 30 Moved crew's berths to the gun deck. Exercised crew at the guns.
November 3 Sent up royal masts.
November 4 Got new suit of sails.
November 23 Crossed the equator.
November 24 Spoke to a Portuguese ship from Madeira; informed that a British frigate was bound to the Cape of Good Hope.
November 27 Between Isles Mayo and St Jago. Sent Lieutenant Downes ashore for word from Commodore Bainbridge.
December 2 Procuring water and provisions.
December 12 Off Brazil captured British packet *Noctor* with $55,000.

17

ecember 13	Dispatched prizes under command of Lieutenant Finch with 17 prisoners and 17 of *Essex* crew.
ecember 14	Made Island of Nronka. Received Bainbridge's instructions. Left a reply.
ecember 29	Captured and burned merchant schooner *Elizabeth* of Rio de Janeiro.
313	
ebruary 14	Rounded Cape Horn. First American Warship to enter the Pacific Ocean.
larch 14	Reached Valparaiso. Replenished supplies.
larch 23	Put to sea.
larch 25	Captured Peruvian schooner *Nereyda*. This ship had captured two American whalers and crews off Chile. Porter had their guns thrown overboard and the ship returned commanded by her own crew with a letter of explanation to the Spanish Viceroy.
pril 5	Re-captured American whaler *Barclay*, a prize of *Nereyda* off Peru. Returned to her captain and sailed in consort with the *Essex*.
pril 29	Captured *Montezuma*, *Policy*, *Georgiana* (Letters of Marque) with boat parties from the *Essex*.
May 29	*Essex* and her prize *Georgiana* captured whalers *Atlantic*, *Greenwich*, *Rose*, *Hector* and *Catherine*.
June 13	Captured whalers *Charlton*, *Seringapatam*, *New Zealander*. *Seringapatam* was recaptured by her own crew. *New Zealander* was re-captured by HMS *Belvidera* in 1814.
August 13	Captured the Whaler *Sir Andrew Hammond* off Galapagos Island.
October 19	Claimed the Marquesas Islands for the US. Established a base for repairs to the *Essex*, built a fort and overcame the inhabitants.
December 12	Sailed from Nukahiva with the *Essex Junior*, ex-*Atlantic*.
1814	
February 3	Entered harbour of Valparaiso. Made minor repairs. *Essex Junior* under Lieutenant Downes sent to patrol the entrance to the habour.
February 9	British frigate *Phoebe* and the sloop *Cherub* sighted at the entrance to the harbour by the *Essex Junior*. Blockaded by the British vessels.
February 25	Prizes *Catherine* and *Hector* burned in Valparaiso harbour.
March 28	*Essex* captured by *Phoebe*, Captain Hillyar, and *Cherub* in Valparaiso harbour. *Essex*: 58 killed, 31 drowned, 66 wounded; British vessels: 5 killed, 10 wounded.
April 27	*Essex Junior* sailed to the US with Captain Porter and paroled Americans.
May 31	The *Essex* and *Phoebe* left Valparaiso in company.
August 4	Arrived at Rio de Janeiro for repairs to the *Essex*. Commissioned as HMS *Essex*.
September 15	Sailed in company with HMS *Nereus* and *Phoebe*.
November 13	Anchored in Plymouth sound. Dismantled. Tied up as a hulk. (She was used as a convict ship from October 1823 and not sold until 6 July 1837).

Mr Philip Chadwick Foster Smith

The Photographs

Although numerous models of the *Essex* exist, few have been built based on the lines of William Hackett. Those which have are now held in private and corporate collections, or still in the hands of the builders themselves. It is through their generosity that we are able to present photographs of models of the *Essex* here. The modelmakers are as follows:

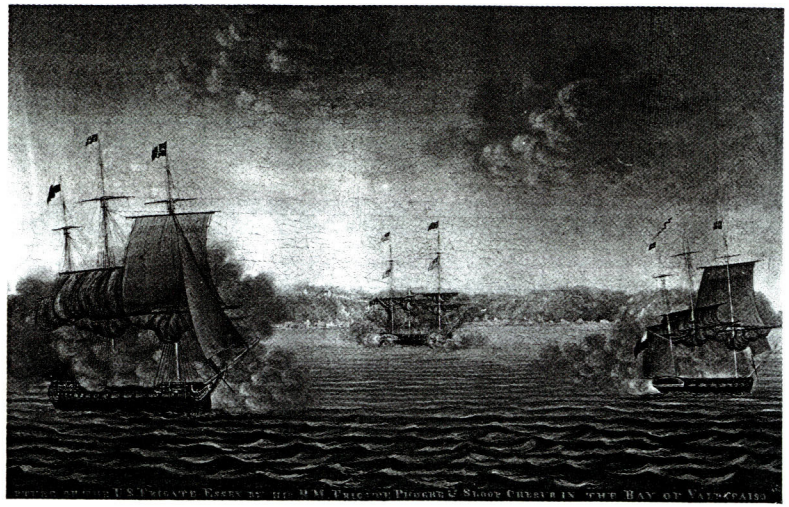
Dr Robert J Dowst — fully rigged model.
Joseph Francella — profile view.
William Amour — model completed to the gun deck, looking aft from the bow; and planked port side view showing the gun deck under construction.
Dr William Brown — deck details of the waist, athwartship view.
Richard L Eddy — view of the spar deck framing.

2. Portrait of Wiliam Hackett by an unknown artist. *The Peabody Museum of Salem*

3. Captain Edward Preble, USN. Engraved by T Kelly from the portrait in Faneuil Hall, Boston. *Author's collection*

4. Captain David Porter, USN. *Author's collection*

5. Captain William Brainbridge, USN. *Author's collection*



6. 'Capture of the US Frigate *Essex* by His BM Frigate *Phoebe* & Sloop *Cherub* in the bay of Valparaiso.' Painting by George Ropes. *The Peabody Museum of Salem*

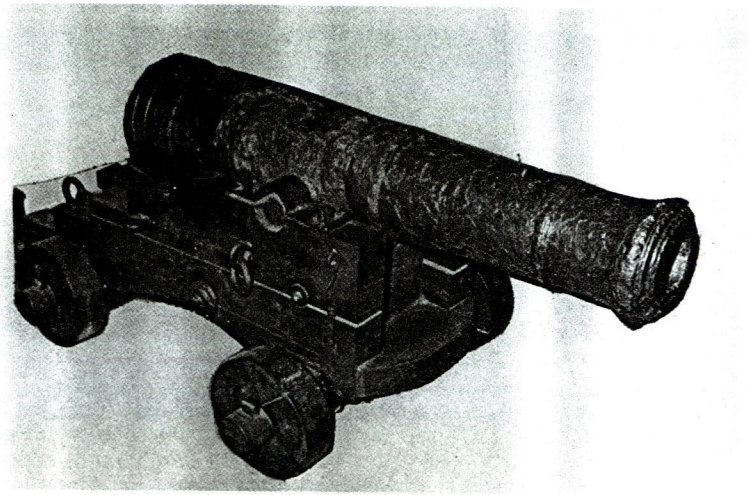
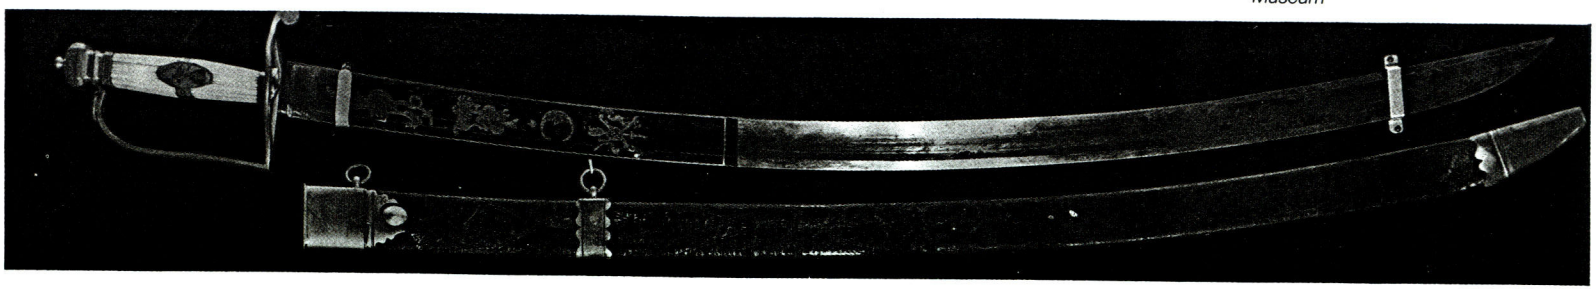
Photo of the Hackett draught courtesy of the National Archives. Lines plan below from Naval Documents Related to the United States Wars with the Barbary Powers.

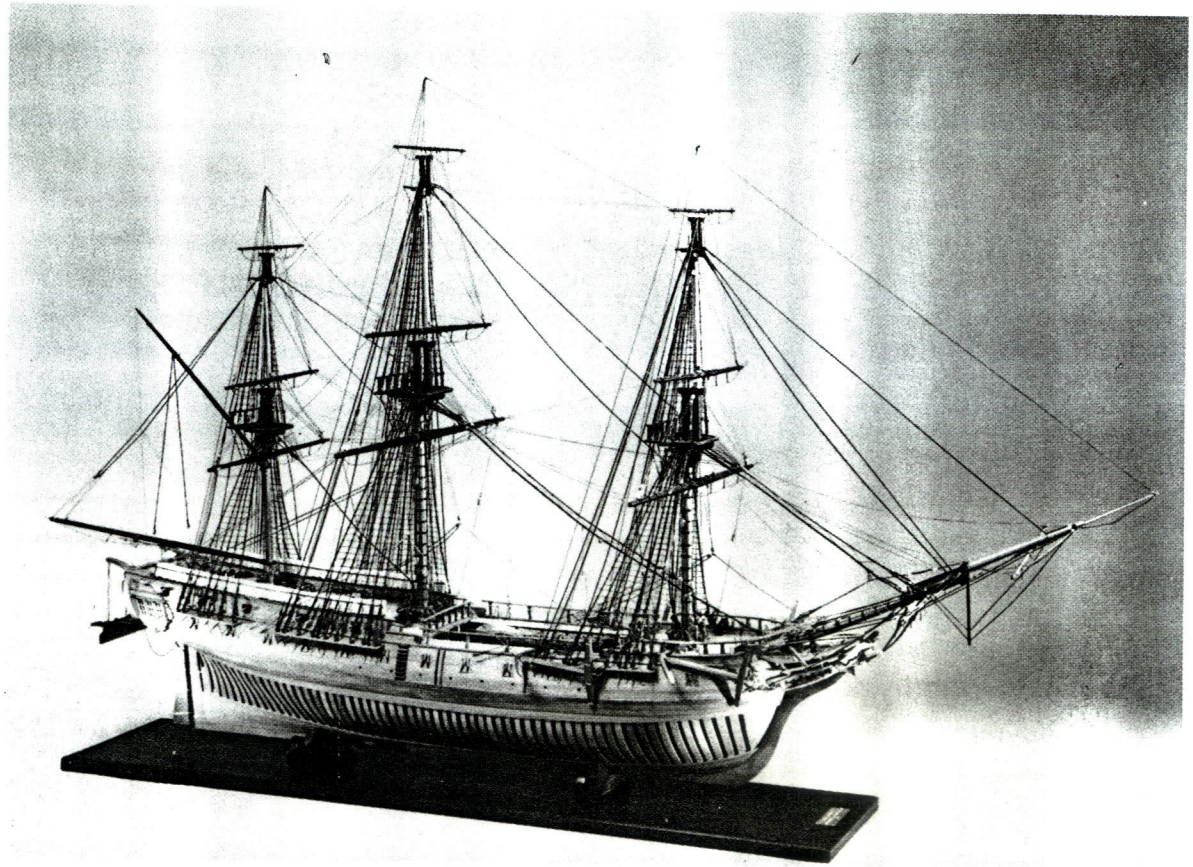


8. 6pdr gun from a Massachussetts privateer scuttled by her crew in 1779. This type is similar to those used on the quarterdeck of the *Essex. Author's collection*

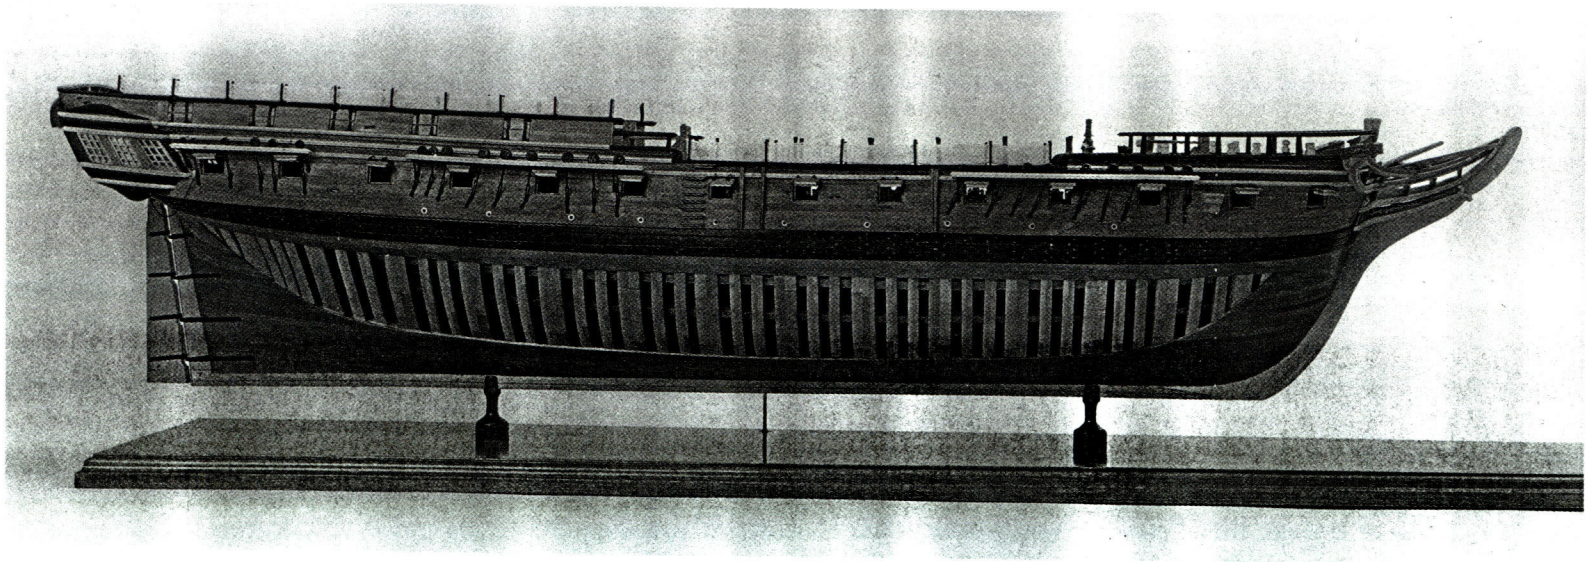
9. Example of a pistol used during the later part of the eighteenth century. Not seen in the photograph is the gun hook on the opposite side. The bolt which fastens the cock also held the hook in line with the barrel of the gun. Unlike the small arms issued to the enlisted men, officers owned their own weapons, and were responsible for their care and maintenance. The pistol shown was the property of Commodore Oliver Hazard Perry. *By courtesy of the United States Naval Academy, Annapolis*

10. Officer's sword belonging to Commodore Edward Preble. *By courtesy of the US Naval Academy Museum*



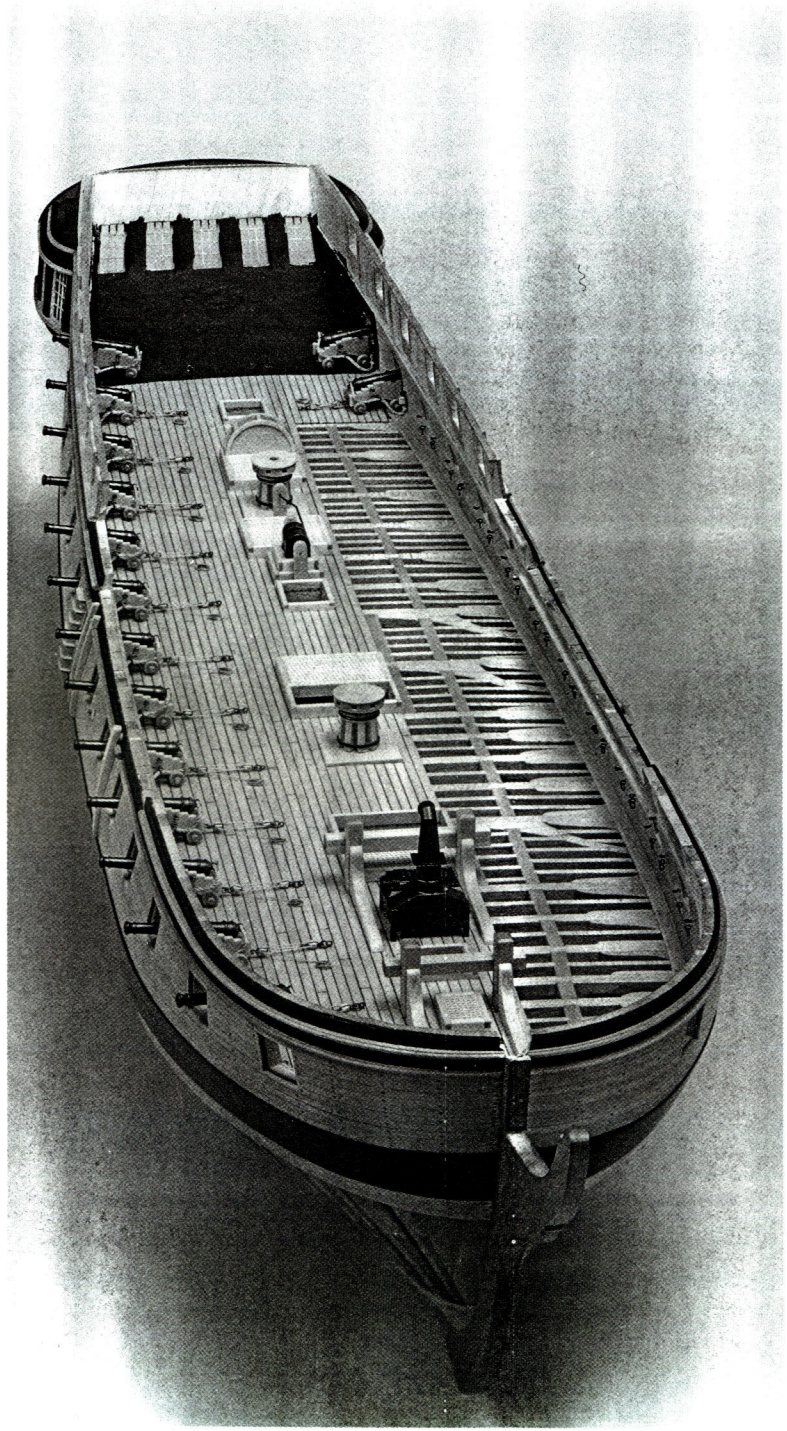


11. Rigged model of the *Essex* showing the influence of the Howard painting. *By courtesy of Dr Robert J Dowst*

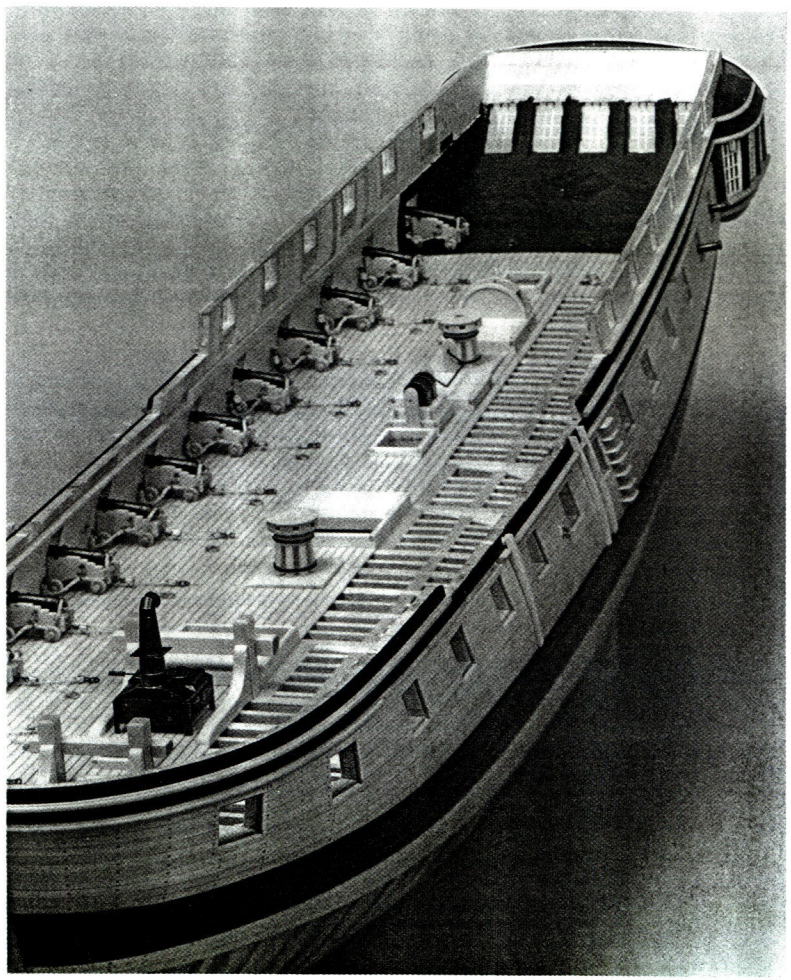


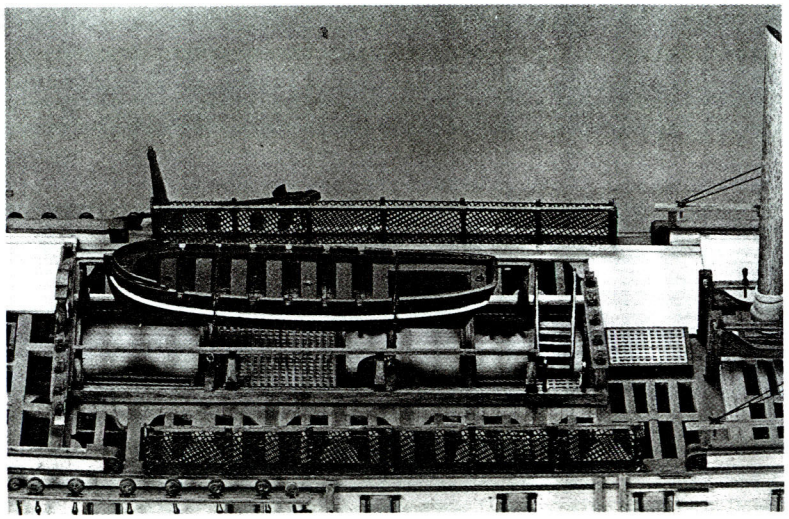
12. Model of the *Essex* based on the lines by William Hackett. *By courtesy of Mr Joseph Francella. Photograph by George Ancona*

13. The beauty of the bow curves is clearly shown in this model under construction by William Amour. The darkened area at the stern will contain the great cabin. *By courtesy of Wiliam Amour. Photograph by Wiener Inc*

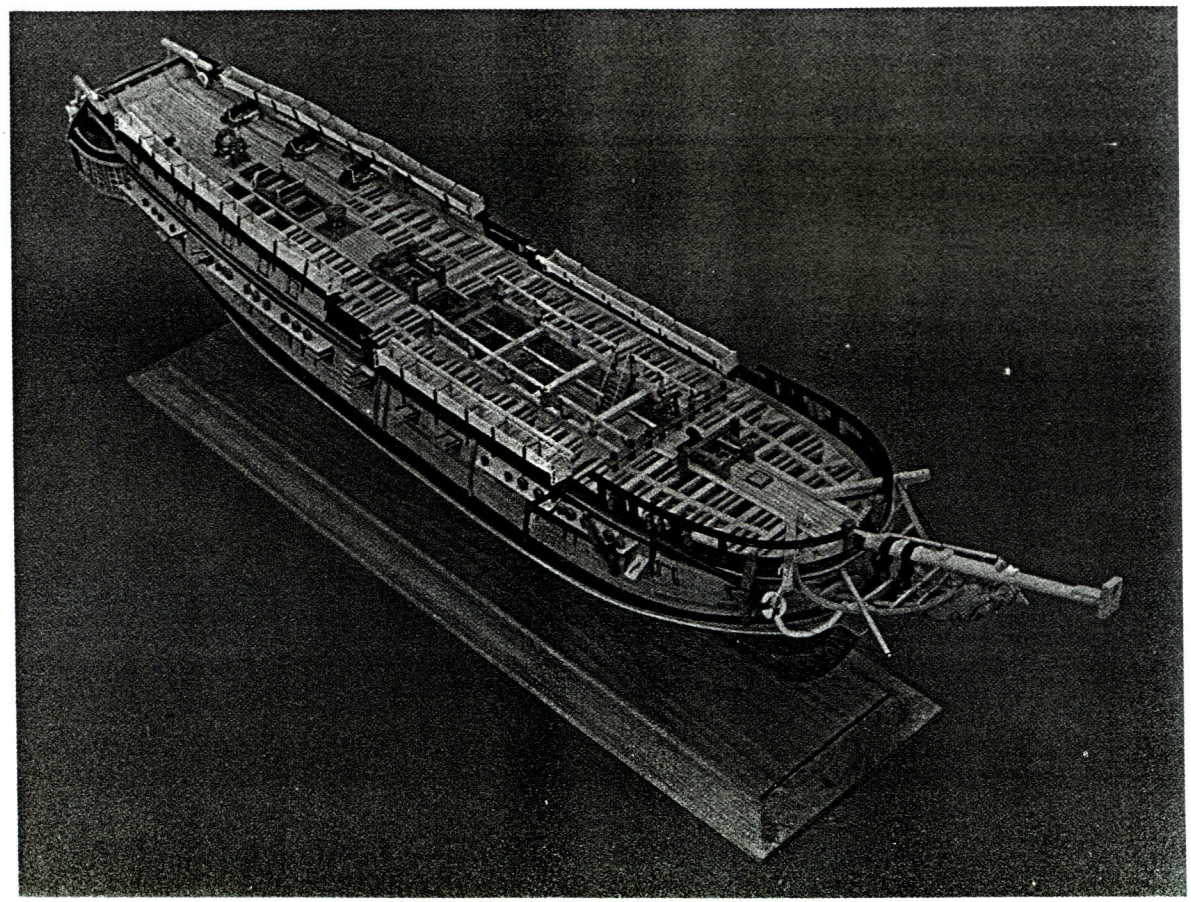


14. The same model from the port side showing some of the deck detail, the upper planking, wales and quarter gallery outboard. The noticeable tumblehome is evident in the quarterdeck bulwarks. *By courtesy of William Amour. Photograph by Weiner Inc*





15. A port side view of the longboat stowed on the skid beams in the waist. A grating has been let into the beams for access to the boat. *By courtesy of Dr William Brown*



16. View of the spar deck with most of the framing exposed. *By courtesy of Richard L Eddy. Photograph by J Blankenship*

The Drawings

Information for all the reconstructed drawings of the frigate *Essex* came from two major sources, the draught by William Hackett and Philip C F Smith's book, *The Frigate Essex Papers*, published in 1974 by the Peabody Museum at Salem. Secondary sources include the author's own research on this vessel and similar types of the period, gathered over more than a decade. Several of the secondary sources include information, often lost in the literature, from articles and notes in periodicals, journals and historical society publications.

Early works on naval architecture illuminated the source of Hackett's information and made possible many of the constructional details, and confirm those referred to in Smith's book. The appendices in *The Frigate Essex Papers* were of inestimable value, for otherwise elusive details such as the painted and varnished fan-back chairs in the wardroom – two of them with arms – as listed in the purser's indent.

The painting, believed to be of the *Essex*, in the Peabody Museum was the source for the design for the figurehead, as noted above. This painting has long been an influence on popular impressions of the *Essex*. The artist's interpretation of the quarter galleries is reflected in a number of models, despite the fact that Hackett clearly indicated the shape and position of the stern knee on his draught at the centreline on his sheer elevation; this was not intended to represent an extension of the quarter board, as the painting, and consequently the models, show. This interpretation, however, has perpetuated the doubts about Hackett's abilities, as both a draughtsman and designer, from that time to the present.

In attempting the reconstruction of the Hackett drawing and its expansion into the line, framing, planking, and other related drawings, I felt it necessary to place complete faith in his capabilities as a designer and in his judgement. It was also my intent to remain as objective as possible while reconstructing the original design in more detail than had been done to date. As work progressed on the drawings it became clear that Hackett's draught was, in effect, a working drawing, developed to determine the size, number and placement of the ship's timbers through notations and calculations.

I have deviated from the normal practice of showing the half-breadth elevations viewed from above, and instead showed them viewed from below. This permits the bottom of the hull to be seen in the plating, framing, and planking diagrams.

The scale of Hackett's draught is based on ¼in = 1ft scale (1/48). Slight variations occur on his scale located below the sheer drawing. Nonetheless, his scale was crucial as a guide to the disposition of timbers. The most accurate section of this scale was used for measurements on the Hackett draught, then transposed to the new drawings using an accurate ¼in scale. The reduced drawings are in multiple reductions of the ¼in scale to suit the format of this volume.

A list of the principal sources for this work is found at the close of the Introduction. Space limitations preclude a complete bibliography.

196 Fore sheet – fore top shroud
197 After sheet
198 Downhauler

Fore topgallant studdingsail
199 Halliard – fore lower top rail
200 Tack – fore lower top
201 Fore sheet – fore lower top
202 After sheet – lashed to yard

Anatomy of the Ship

On the successful completion of the War of Independence, the American navy was disbanded, and it was not until the late 1790s that a regular naval force was reconstituted. Provoked by the need to protect American merchant shipping from the belligerent European nations and the piratical Barbary powers, Congress decided on a programme of frigate building, which included the 32-gun frigate *Essex*.

Designed by William Hackett, *Essex* was a typical medium frigate of her time. Working from both US and British sources, the author has reconstructed many previously undetermined details of the ship and in passing has rehabilitated the reputation of the designer as one who was responsible for one of the best balanced of that generation's frigates.

This volume features

- A detailed introduction which outlines the historical background and building of the ship before going on to describe her career, particularly her period in the Pacific when she effectively destroyed the British whaling fleet.
- A picture section depicting the most reliable models of the ship.
- A guide to the ship's colour scheme and decoration on the book jacket.
- More than 300 perspective and 3-view drawings with in-depth descriptive keys, of every detail of the ship – general arrangements, hull construction, fittings, decoration, mast, yards, rigging, sails and armament.

A complete anatomy of the ship in words, photographs and drawings.
